Modularization

Conclusions

The implementation of a programming language is a complex task that involves several implementation aspects, such as:

- Syntax and semantics definition
- Error handling
- IDE support
- Type system definition
- Documentation
- Code generation

It is usually done in a **monolithic** way with a **top-down** approach, where all the aspects are tightly coupled.

Modularization

Conclusions

The implementation of a programming language is a complex task that involves several implementation aspects, such as:

- Syntax and semantics definition
- Error handling
- IDE support
- Type system definition
- Documentation
- Code generation

It is usually done in a **monolithic** way with a **top-down** approach, where all the aspects are tightly coupled.

This makes the **maintainability**, **extensibility** and **reusability** of the implementation difficult.

Modularization

Conclusions

In 2016, Microsoft in collaboration with Red Hat introduced the Language Server Protocol (LSP) and the Debugger Adapter Protocol (DAP).

The LSP and DAP are JSON-RPC based protocols that allow the communication between a Language Server and an IDE.

Intrinsic properties:

- Language-agnostic
- IDE-agnostic
- Asynchronous
- Text-Based

Features:

- Diagnostics
- Hover
- Go to definition
- Find references

Modularization

Conclusions

Since 1990s, researchers have been working on the concept of **Software Product Lines** (SPLs) to move towards a more **modular** world.

- SPLs defines a **family** of software products.
- SPLs is described By a **Feature Model**.
- A Feature Model describes the **variability** of the software.
- SPL **variants** are generated by selecting a set of features.
- A **feature** (or **artifact**) is a first-class entity in SPLs.

# Language Product Lines

Universal LSP  
and DAP for  
Modular LWS

Federico  
Bruzzone

Applying the concept of SPLs to programming languages, we  
obtain the concept of **Language Product Lines** (LPLs).
